

Chemical and Ecological Health of White Sucker (*Catostomus Commersoni*) in Rock Creek Park, Washington, D.C., 2003-04: USGS Scientific Investigations Report 2006-5140

Chemical and Ecological Health of White Sucker (*Catostomus Commersoni*) in Rock Creek Park, Washington, D.C., 2003-04: USGS Scientific Investigations Report 2006-5140

et al., Cherie V. Miller, Holly S. Weyers

Several classes of chemicals that are known or suspected contaminants were found in bed sediment in Rock Creek, including polyaromatic hydrocarbons (PAHs), phthalate esters, organochlorine pesticides, dioxins and furans, trace metals and metalloids (mercury, arsenic, cadmium, chromium, cobalt, copper, lead, nickel, silver, and zinc), and polychlorinated biphenyls (total PCBs and selected aroclors). Concentrations of many of these chemicals consistently exceeded threshold or chronic-effects guidelines for the protection of aquatic life and often exceeded probable effects levels (PELs).
